Huntwood Green

HUNTWOD The Most Environmentally

Huntwood's cabinets are manufactured with the utmost concern for the environment. Our product offering is structured to provide

users with a wide selection of choices; enabling them to select the environmentally responsible cabinet configuration that best suits their needs. From careful management of renewable materials to our state-of-the-art finishing process, Huntwood leads the way in eco-friendly cabinetry.

Award-Winning Finishing Process

Huntwood has received awards from government agencies for its ultra-low VOC (Volatile Organic Compound) emissions. This state-of-the-art finishing system

includes a material reclamation system, recycling surplus application materials and minimizing waste. Excess materials produced from the

paint process are recycled, with 80% of the material being reused in future applications. This eco-friendly process significantly reduces environmental impact and is safer than hazardous water-borne systems.

Friendly Cabinet Facility in the World.

Sustainable Materials

Materials used in the manufacture of the Huntwood product are engineered to have minimal impact upon the environment. Exterior components are produced using renewable material selectively harvested from forests managed by companies committed to sustainable resources. Interior

components utilize panel material compliant with EPP (Environmentally Preferable Products) CPA

2-06. Additionally, over 74% of the material used for interior components meets the EPP CPA 2-06 specification for recycled/recovered fiber content. We use only non-urea added formaldehyde plywood and particleboard because it is better

for the planet and better for the air quality inside your home.

Product Durability

Only the toughest materials and strongest construction methods are employed in the creation of each Huntwood cabinet. Every product is designed to stand up to decades of daily use and comes with a limited lifetime

warranty. Huntwood sets a high standard for durability, and in so doing, reduces the burden upon our natural resources.

A Higher Standard of Green.

Energy Conservation

Huntwood's manufacturing facility was designed with a variety of energy-saving features. The plant incorporates a sophisticated lighting technology that reduces the use of electric powered lighting as natural daylight increases. The plant features a

heating and cooling system that adjusts the temperature throughout the building, maintaining an

adequate degree of comfort without wasting energy.

Waste Management

The waste produced in the milling of wood and panel components for the Huntwood product is conveyed to grinders and converted to sawdust. The sawdust is collected and stored in a managed location until

it is sent to paper mills which use it to generate energy for their operations. The careful management of waste product significantly reduces contribution to land fills, thus reducing our impact on the environment.
